

## Problem 1

Consider a processor with the following instructions

instruction		format
mnemonic	meaning	XXXX : not used
AD1 <i>rs, rf</i>	$rs \leftarrow ADD(rs, rf)$	00   <i>rs</i>   <i>rf</i>   XXXX   00
AD2 <i>rs, #cte</i>	$rs \leftarrow ADD(rs, cte)$	00   <i>rs</i>   <i>cte</i>   01
AD3 <i>rs, (rf)</i>	$rs \leftarrow ADD(rs, M[rf])$	00   <i>rs</i>   <i>rf</i>   XXXX   10
AD4 <i>rs, dir</i>	$rs \leftarrow ADD(rs, M[PC+1+dir])$	00   <i>rs</i>   <i>dir</i>   11
JZ <i>offset</i>	if $Z == 1$ $PC \leftarrow ADD(PC+1, offset)$	10   <i>offset</i>

Words of 16 bits; register file with 16 registers;  
2 last bits of ADj represent the addressing mode of  
the second operand; PC increases by 1

- Draw the design of the datapath.
- Design the control unit.
- Add to the design the instruction

LAC *rd, rd* ←  $M[AC]$ , 11 | xxxxxxxx | *rd*

where AC is a specific use register

## Problem 2

Suppose we have a working processor of Problem 1.

Given the memory content shown in the table having the PC content 0045<sub>hex</sub> and assuming the registers are clean, i.e. they have a content of 0.

Let the binary *cte*, *dir* and *offset* represent two's complement numbers; e.g. see Section 2.4 of HP.

Determine now for the empty table the development of the memory and register content when we step through the corresponding program.

pos	content
...	...
29 <sub>hex</sub>	0033 <sub>hex</sub>
2a <sub>hex</sub>	0042 <sub>hex</sub>
2b <sub>hex</sub>	0008 <sub>hex</sub>
...	...
41 <sub>hex</sub>	0023 <sub>hex</sub>
42 <sub>hex</sub>	000a <sub>hex</sub>
43 <sub>hex</sub>	0c01 <sub>hex</sub>
44 <sub>hex</sub>	0001 <sub>hex</sub>
45 <sub>hex</sub>	1793 <sub>hex</sub>
46 <sub>hex</sub>	0542 <sub>hex</sub>
47 <sub>hex</sub>	0bd5 <sub>hex</sub>
48 <sub>hex</sub>	0480 <sub>hex</sub>
49 <sub>hex</sub>	0405 <sub>hex</sub>
4a <sub>hex</sub>	8002 <sub>hex</sub>
4b <sub>hex</sub>	0801 <sub>hex</sub>
4c <sub>hex</sub>	0c01 <sub>hex</sub>
4d <sub>hex</sub>	1001 <sub>hex</sub>
4e <sub>hex</sub>	1401 <sub>hex</sub>

Instruction address	mnemonic	Operands source	Operand destination	Value to write
